

HALOALKANES & HALOARENES

R-X

Haloalkane

A_n-X

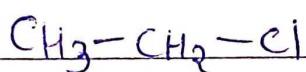

Haloarene

⇒ Classification of Haloalkane & Haloarene:

① On the basis of no. of Halogen atom

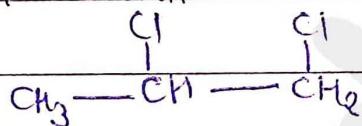

(a) Haloalkane

(i) Monohaloalkane.

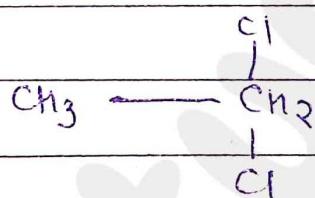

chloroethane

(ii) Dihaloalkane

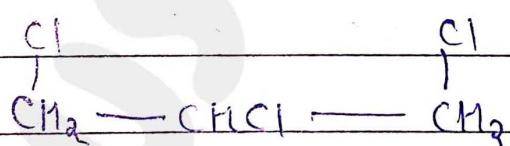

1,2-dichloropropane.

1,1-dichloroethane

(iii) Trihaloalkane

1,2,3-trichloropropane.

(b) Haloarene.

(i) Monohaloarene.

chlorobenzene

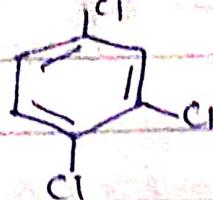

(ii) Dihaloarene

1,2-dichlorobenzene,

o-dichlorobenzene.

(iii) Tertiary halocarbenes

1,2,4 - trichlorobenzene

(2)

Compound Containing sp^3 C-X bond

(a) Alkyl halide

(i)

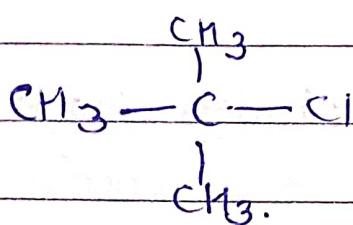

chloro ethane (1°)

(ii)

2 - chloro propane (2°)

(iii)

2 - chloro - 2 methyl propane

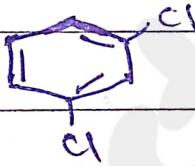

(b) Aryl Halide

(i)

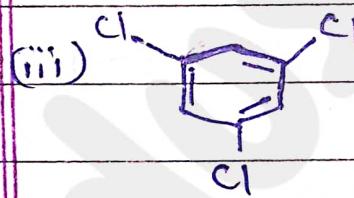

chlorobenzene

(ii)

1,3-dichlorobenzene

(iii)

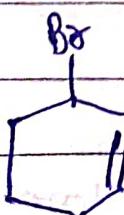

1,3,5 - trichlorobenzene

(c) Allylic Halide

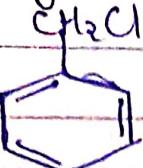

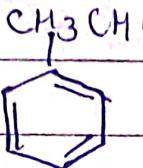

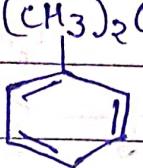

3 - chloropropene

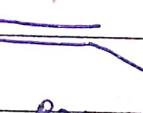

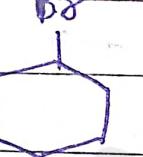

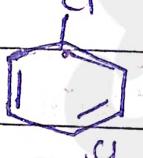

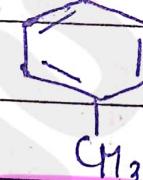

3 - Bromocyclohexene

(d) Benzyllic halide:

- (i)  chlorophenyl methane
- (ii)  chlorophenyl ethane
- (iii)  2-Bromo 2 phenyl propane

(3) Compound Containing sp^2 C-X Bond

Vinyl Halide:

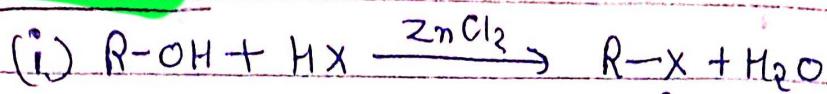

- (i)  chlorobenzene
- (ii)  Bromocyclohexene
- (iii)  chlorobenzene
- (iv)  p-chlorotoluene

Geminal & Vicinal dihalide

- (i) $CH_3CH_2CH(Cl)_2$ gem-dichloropropane
- (ii) $CH_3CH(Cl)CH(Cl)$ Vic.-1,2-dichloropropane

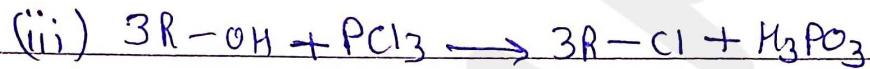

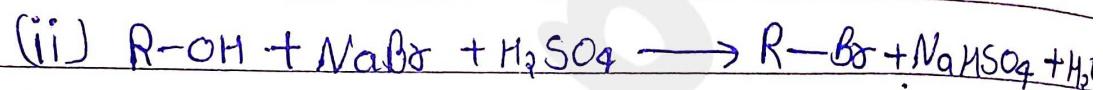

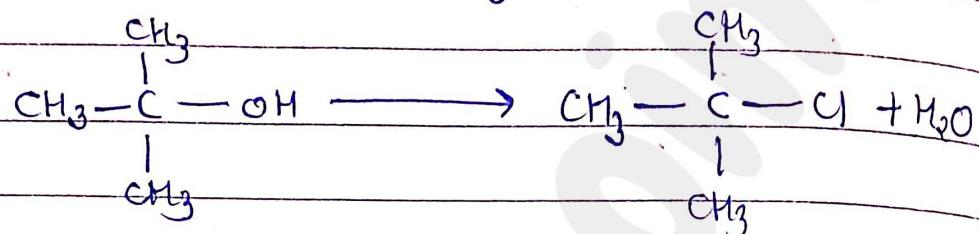

Preparation of Haloalkane

① From Alcohol :-

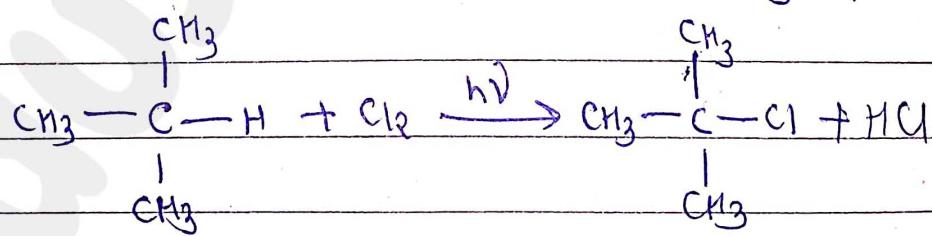

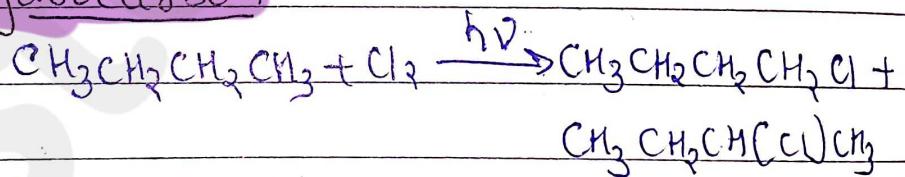

The equimolar mixture of HCl & $ZnCl_2$ is known as Gras Reagent.

Order of Reactivity - $3^\circ > 2^\circ > 1^\circ$

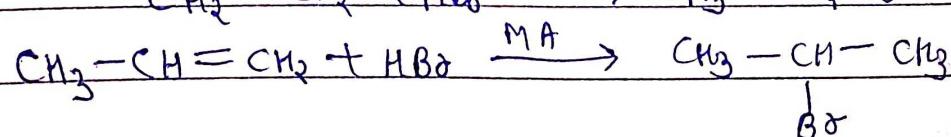

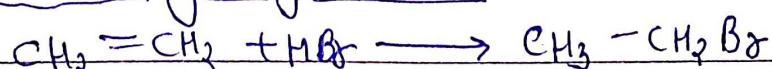

② From Hydrocarbon :-

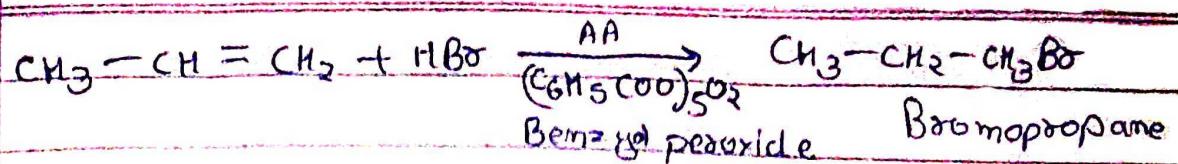

③ From Alkene :-

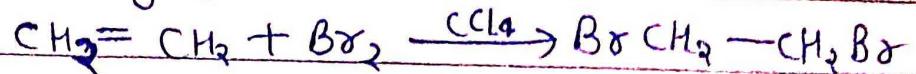

(a) Addition of Hydrogen halide

2-Bromo propane

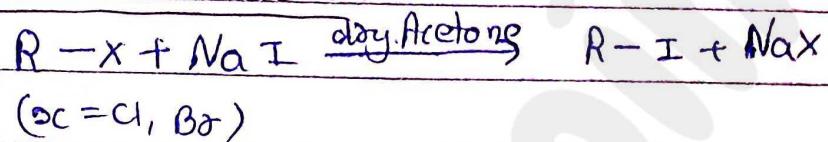

(b) Addition of Halogen

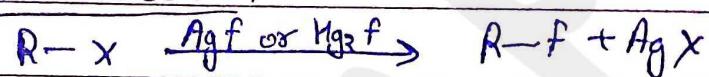

(4) from Halogen exchange

(a) Finkelstein Reaction

(b) Swart Reaction

Physical Properties of Haloalkanes

① Physical State :-

C_1 to C_2 \longrightarrow Colourless gases
 C_3 to C_{18} \longrightarrow Colourless, Sweet Smell,
 C_{18} to onwards \longrightarrow Solid

Q) Melting & Boiling Point: - Haloalkane has higher B.P.

than alkane because of the polarity of Cx bond & greater strength of Dipole-Dipole Interaction

(i) $\text{CH}_3\text{F} < \text{CH}_3\text{Cl} < \text{CH}_3\text{Br} < \text{CH}_3\text{I}$

(ii) $\text{CH}_3\text{Cl} < \text{CH}_2\text{Cl}_2 < \text{CHCl}_3 < \text{CCl}_4$

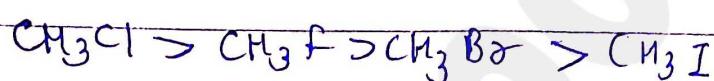

$$(iii) \text{CH}_3\text{Cl} < \text{C}_2\text{H}_5\text{Cl} < \text{C}_3\text{H}_7\text{Cl}$$

(iv) nbutyl chloride > Sec - butylchloride > t - butyl chloride.

③ Density :- $\text{CH}_3\text{F} < \text{CH}_3\text{Cl} < \text{CH}_3\text{Br} < \text{CH}_3\text{I}$
 $\text{CH}_3\text{Cl} < \text{CH}_2\text{Cl}_2 < \text{CHCl}_3 < \text{CCl}_4$

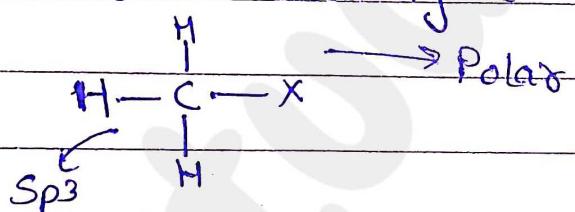

④ Solubility : Haloalkane are not Soluble in water because they are not able to form H-bond. It Soluble in organic Solution like Benzene, ether, Acetone, CCl_4 etc.

⑤ Dipole Moment :- (Polarity of Bond)

Chemical properties of Haloalkanes :-

Nature of Reactivity (C-X bond)

$\text{I} > \text{Br} > \text{Cl}$ (Size of Halogen atom)

$3^\circ > 2^\circ > 1^\circ$ (No. of Halogen)

$\text{CH}_3\text{Cl} < \text{C}_2\text{H}_5\text{Cl} < \text{C}_6\text{H}_5\text{Cl}$ (Nature of Alkyl halide)

(i) Polarity of Bond - $\text{CH}_3\text{Cl} > \text{CH}_3\text{F} > \text{CH}_3\text{Br} > \text{CH}_3\text{I}$

(ii) Bond length - $\text{CH}_3\text{F} < \text{CH}_3\text{Cl} < \text{CH}_3\text{Br} < \text{CH}_3\text{I}$

(iii) Bond Enthalpy - $\text{CH}_3\text{F} > \text{CH}_3\text{Cl} > \text{CH}_3\text{Br} > \text{CH}_3\text{I}$

Types of Chemical Reactions . . .

① Nucleophilic Substitution Reaction.

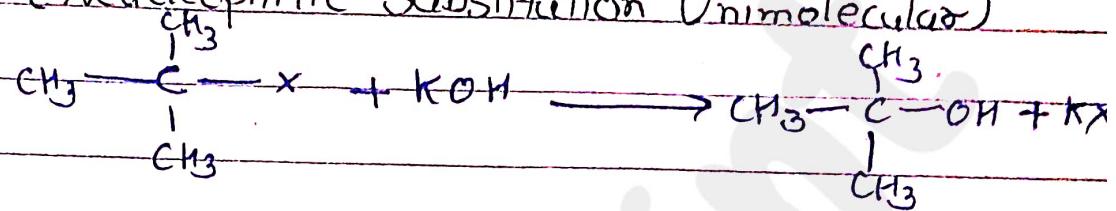

② β - elimination / Dehydrohalogenation

③ Reaction with Metal

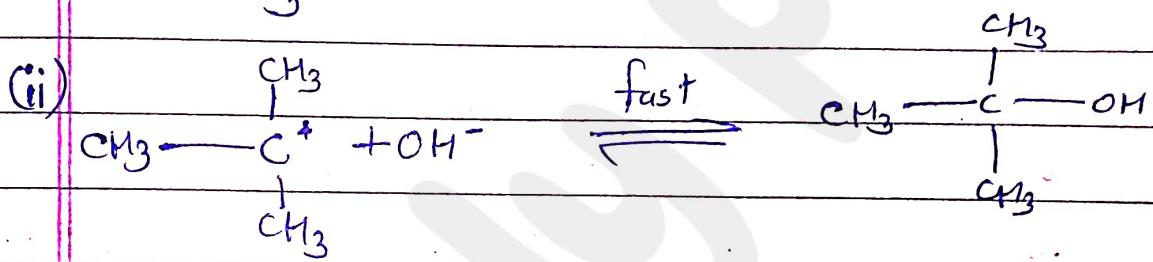

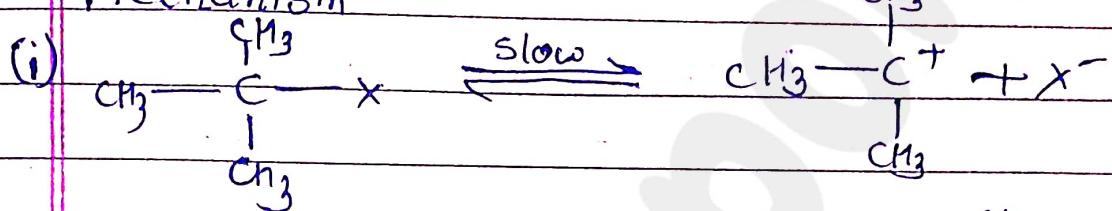

① Nucleophilic Substitution Reaction

(a) SN' (Nucleophilic Substitution Unimolecular)

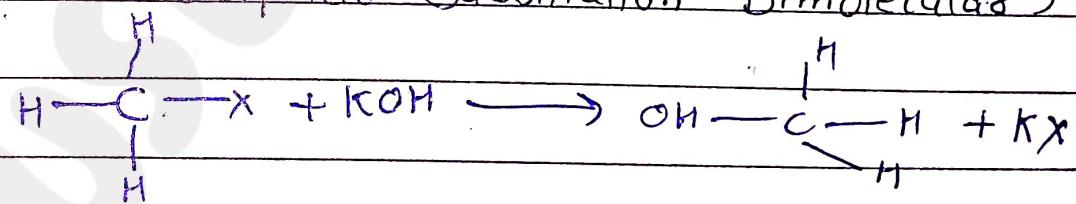

Mechanism

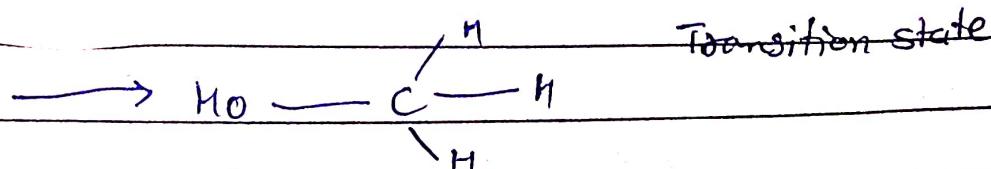

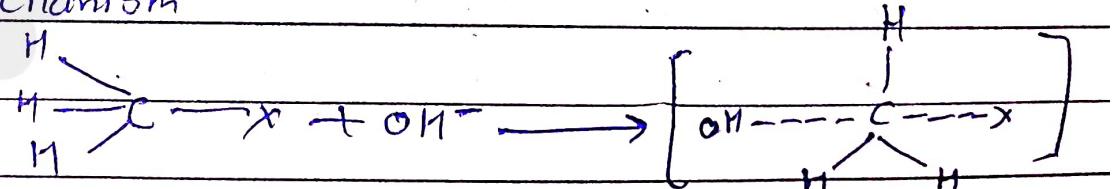

The order of reactivity of Alkyl halide in SN' is $3^\circ > 2^\circ > 1^\circ$

(b) SN^2 (Nucleophilic Substitution Bimolecular)

Mechanism

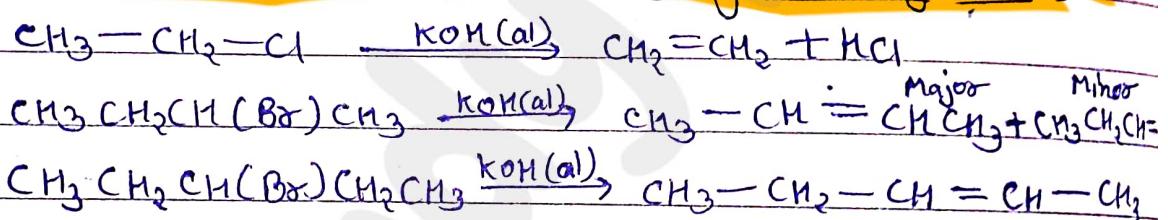

The order of Reactivity of Alkyl halide in SN^2 is $1^\circ > 2^\circ > 3^\circ$

Nucleophilic Substitution Reaction

- $R-X + NaOH \longrightarrow R-OH + NaX$
 $R-X + NaOR \longrightarrow R-O-R + NaX$
 $R-X + KCN \longrightarrow R-CN + KX$
 A $R-X + AgCN \longrightarrow R-NC + AgX$
 * $R-X + KNO_2 \longrightarrow R-ONO + KX$
 $R-X + AgNO_2 \longrightarrow R-NO_2 + AgX$
 $R-X + RCOONa \longrightarrow R-C(=O)OR + NaX$
 $R-X + NH_3 \longrightarrow R-NH_2 + HX$
 $R-X + LiAlH_4 \longrightarrow R-H + XH$
 $R-X + NaSH \longrightarrow R-SM + NaX$

(2)

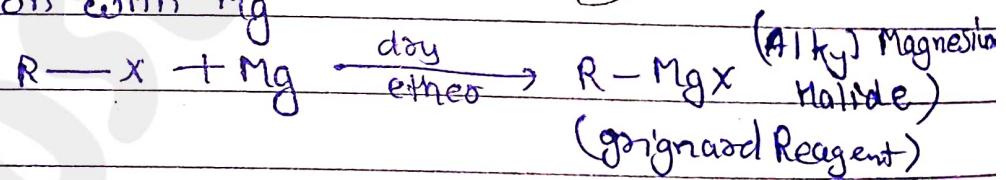

β -elimination Reaction (Dehydrohalogenation)

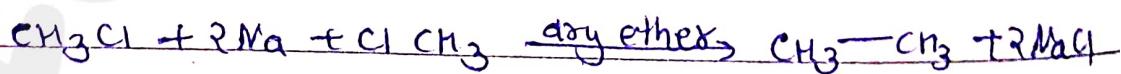

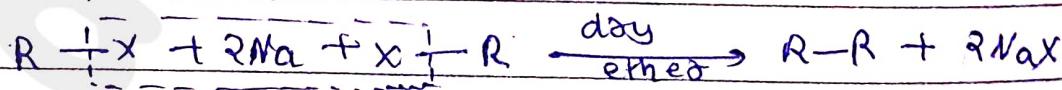

(3)

Reaction with Metal

(a) Reaction with Mg

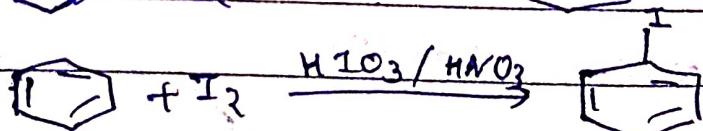

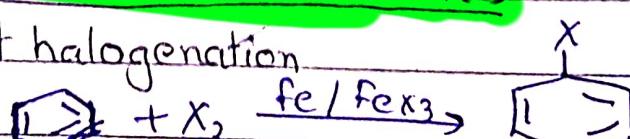

(b) Reaction with Na

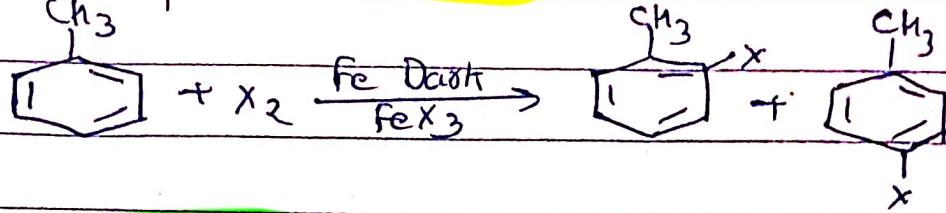

#

Preparation of Halogenes

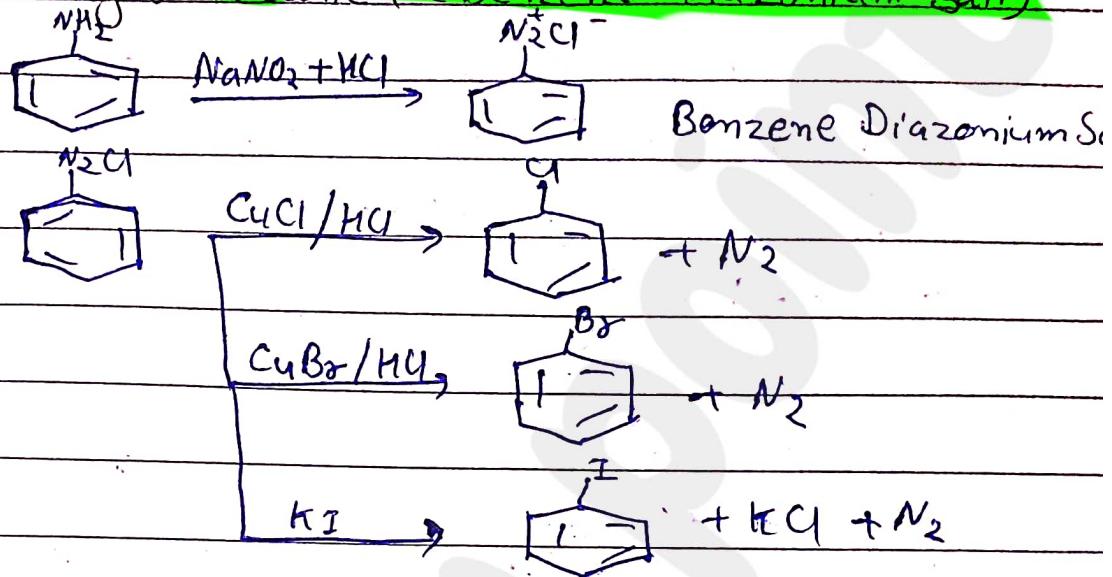

(1) By direct halogenation

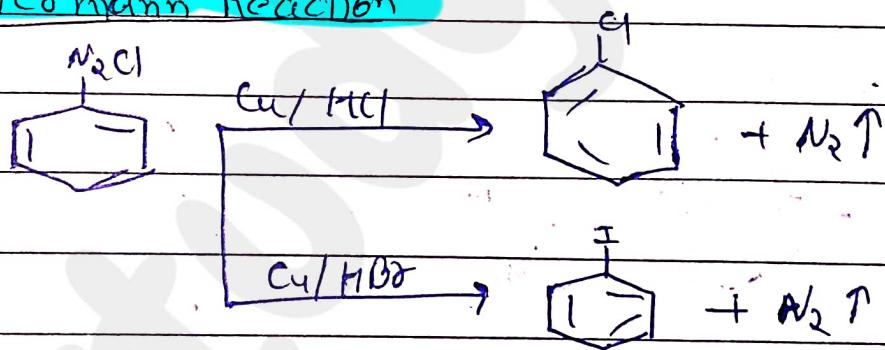

② By electrophilic Substitution

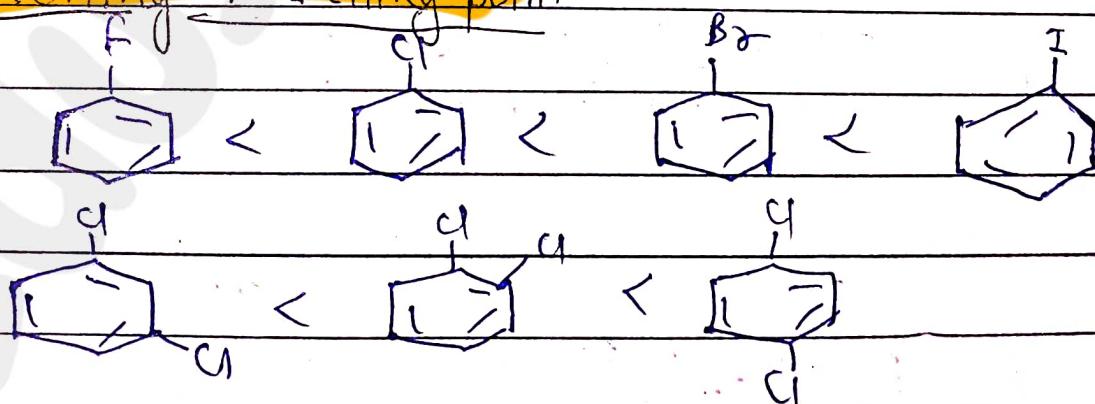

③ Sandmeyer Reaction (Benzene Diazonium salt)

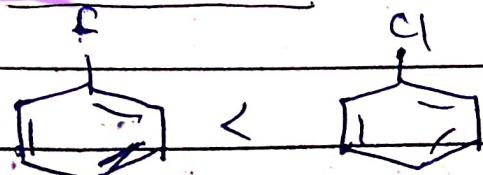

④ Gattermann Reaction

Melting & Boiling point

Dipole moment

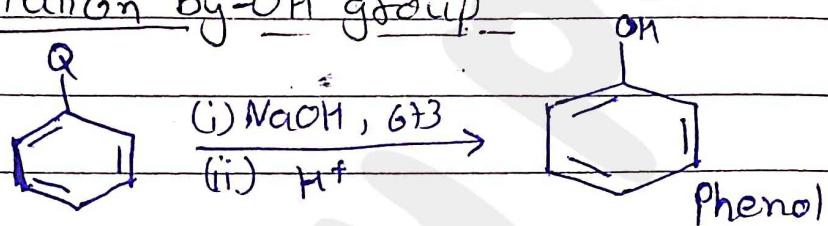

Chemical properties :-

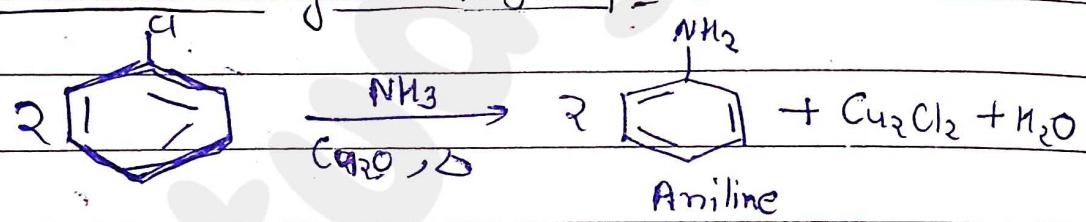

① Nucleophilic Substitution Reaction :- Aroyl Halide are less Reactive towards Nucleophilic Substitution Rxn due to following Reasons -

- C-X bond Acquires partial double bond character because of the Resonance.
- Due to sp^3 Hybridised Carbon
- In-Stability of Phenyl Cation.

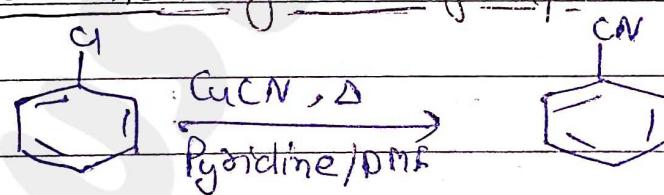

(a) Substitution by -OH group -

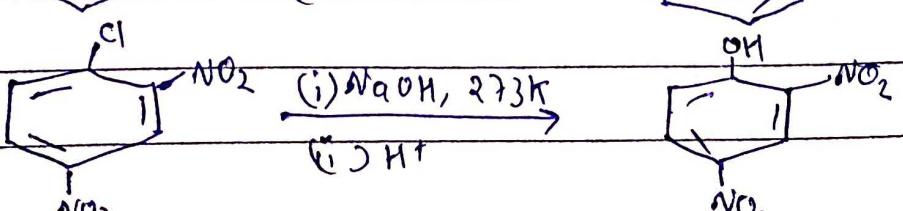

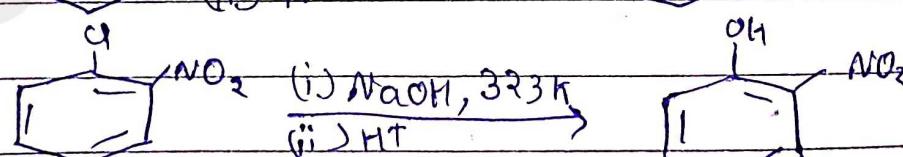

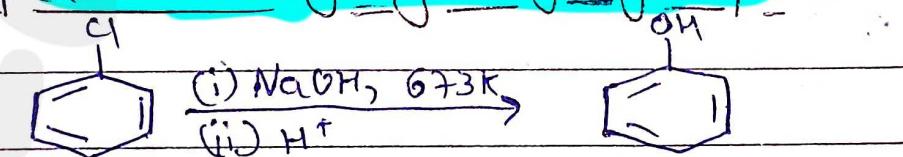

(b) Substitution by $-NH_2$ group -

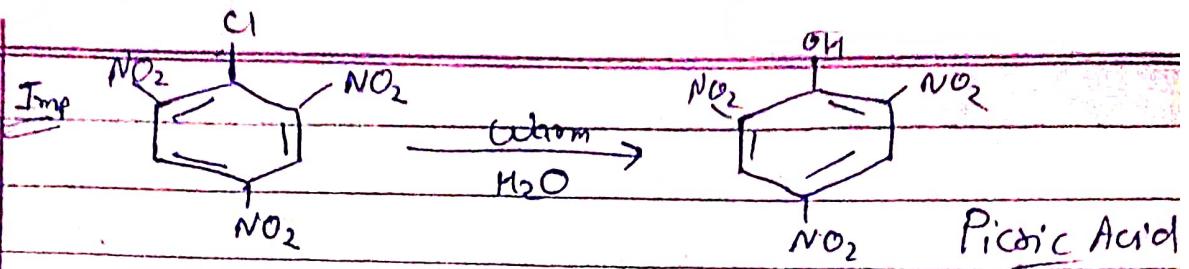

(c) Substitution by $-CN$ group -

② Replacement by hydroxyl group -

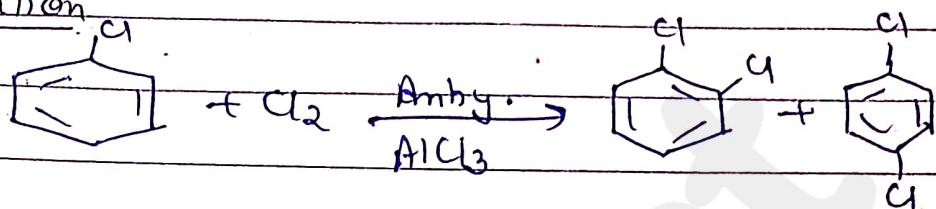

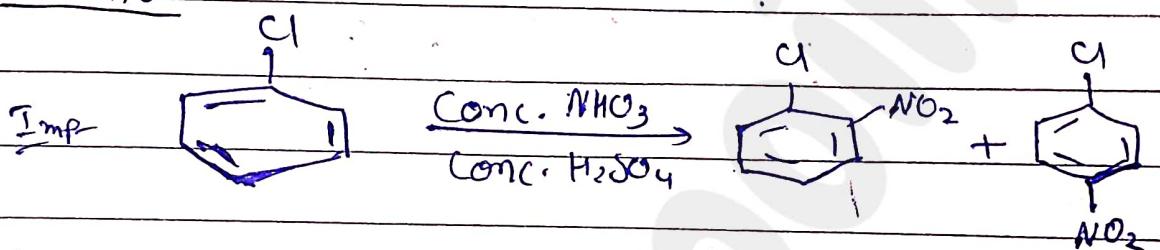

(3)

Electrophilic Substitution Reaction

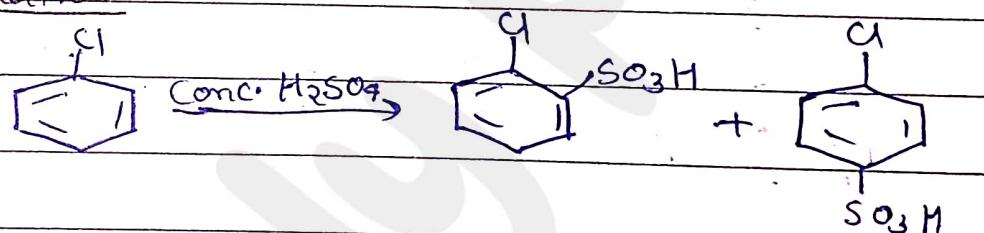

(a) Halogenation

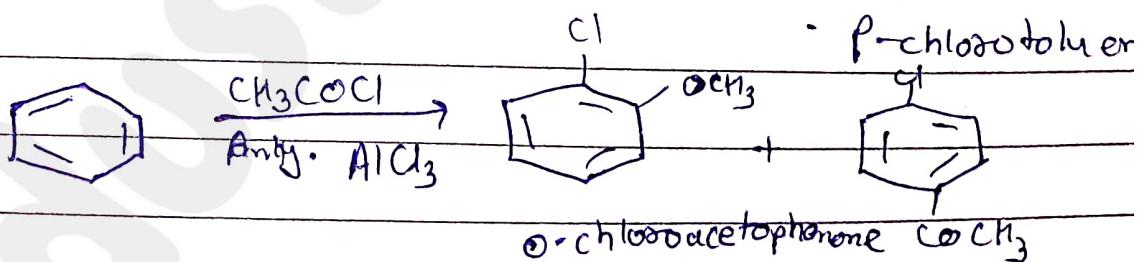

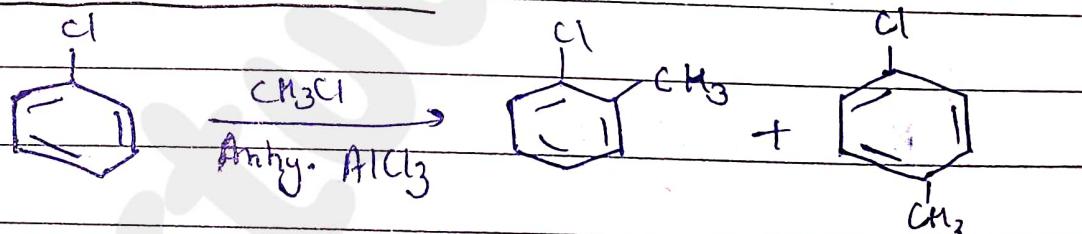

(b) Nitration

(c) Sulphonation

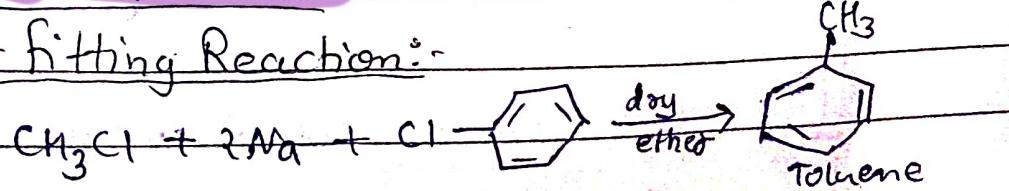

(d) Friedel-Crafts Reaction:

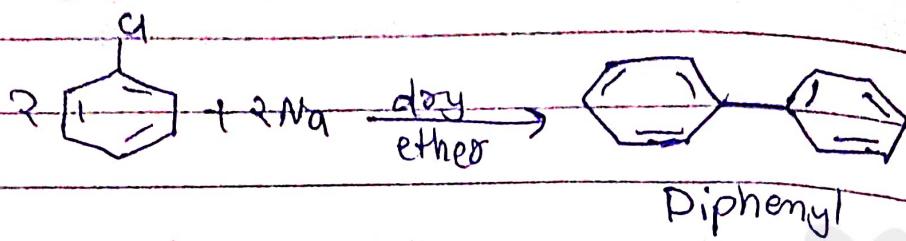

(4)

Reaction with Metals:

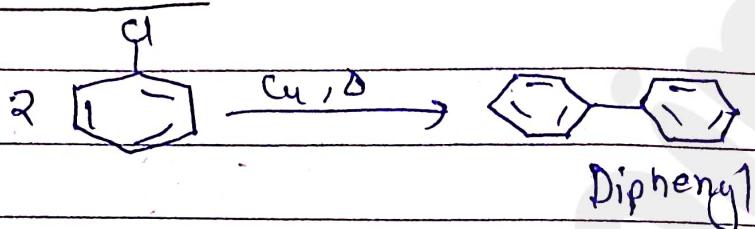

(a) Wurtz-fittig Reaction:

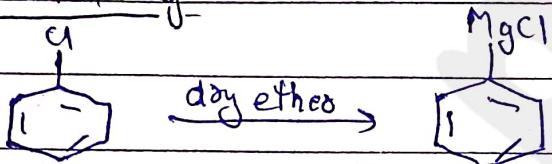

(b) Fitting Reaching

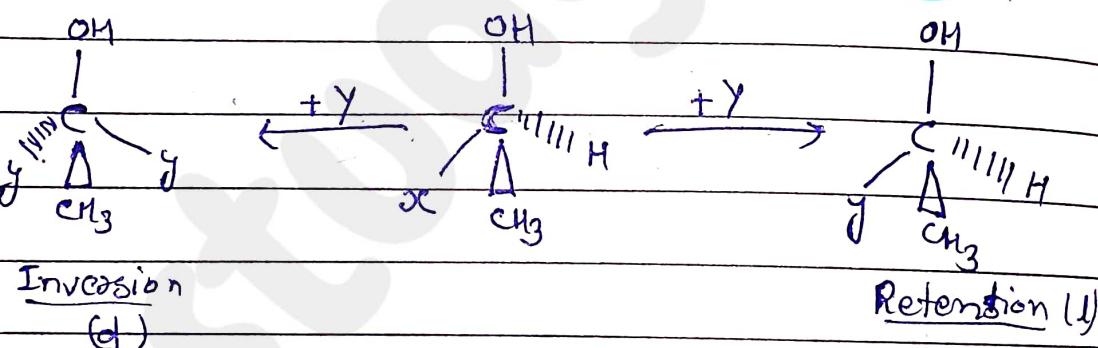

(c) Ullmann Reaction

(d) Reaction with Mg

Petention, Inversion & Racemic mixture:

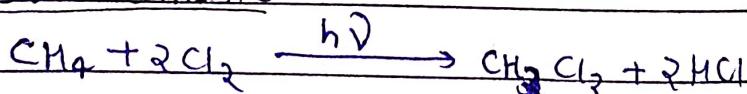

Racemic Mixture :- Petention + Inversion

50%

50%

Polyhaloalkane

① Dichloromethane

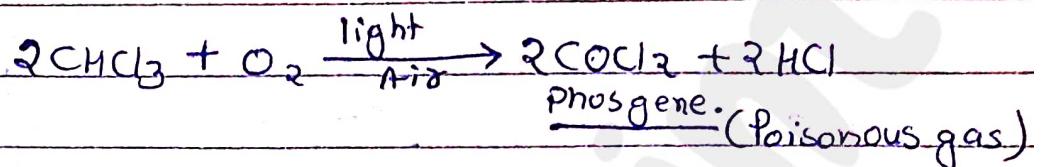

Use:- Used as a solvent in pharmaceutical & food Industry

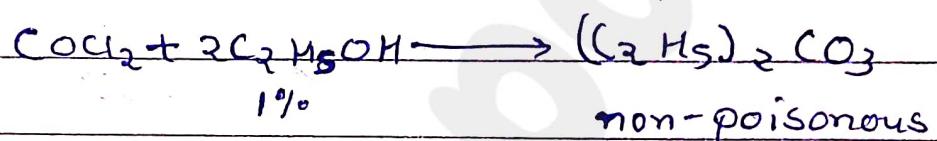

② CHCl_3 (Chloroform)

It is stored in dark colour bottle because it get oxidised in the presence of light & Air to form a poisonous gas phosgene (COCl_2)

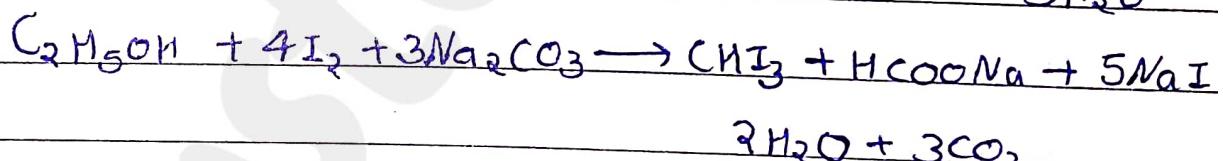

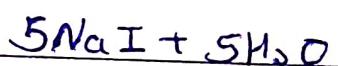

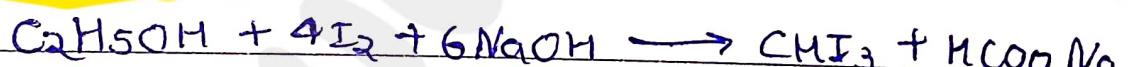

1% ethanol added to chloroform it produce diethyl carbonate which are non-poisonous.

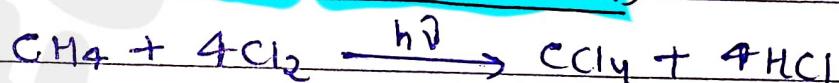

Use:- It is used as a solvent in industry for waxes, rubber, & resins.

③ Iodoform (CHI_3)

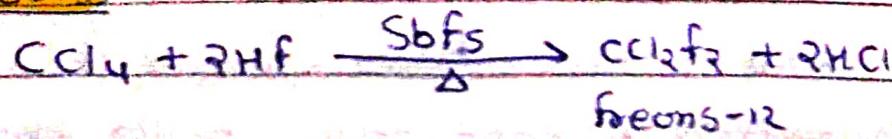

Use:- it is used as antiseptic.

④ Carbon tetrachloride (CCl_4)

It is used as a solvent in laboratory. It is used in manufacture of refrigerants & propellants for aerosol cans.

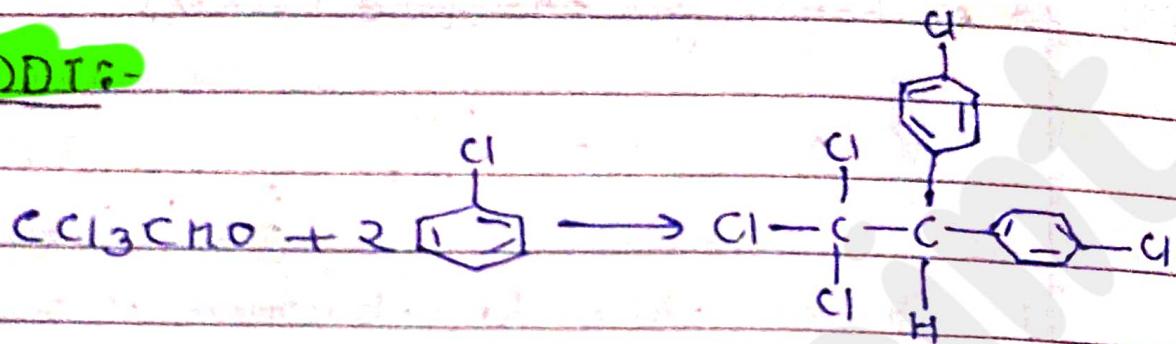

⑤ Freons :-

Freons-12

It is also used as a refrigerant for cooling

⑥ DDT :-

P,P-dichlorodiphenyltri-chloroethane

(2,2-bis(4-chlorophenyl)

(1,1)-trichloroethane
